A total of 208 pictures consisting of geometric figures are presented.
The ACE-R1 is a brief cognitive test that assesses five cognitive domains, namely attention/orientation, memory, language, visuospatial skills, and executive function. It is designed to be administered quickly and easily, with results obtained within a few minutes. The test is useful for screening purposes and can be used to monitor cognitive decline in neurological conditions such as Alzheimer's disease and Parkinson's disease. The ACE-R1 is intended for use in clinical settings, such as in the evaluation of patients presenting with cognitive symptoms or in the assessment of cognitive functioning in research studies. The test is also useful for quick screening of elderly patients and can be administered by non-neuropsychologists. Presenting neurological diagnoses included seizure disorder, closed head injury, and multiple sclerosis. Further research is needed to determine the full utility and effectiveness of the ACE-R1 in clinical practice.
